PROJECT

LT OBSERVATORY

Languages for a Digital Single Market

The LT Observatory project (Observatory for Language Resources and Machine Translation in Europe), coordinated by ZABALA, arises from the need for multilingual solutions for European companies and researchers. The aim is to eliminate language barriers to take advantage of the usefulness of content and data and thus avoid the loss of business opportunities.

01 Challenge

The Digital Single Market will require the removal of many barriers, including language barriers. LT_Observatory wants to facilitate access to language resources to support the development of multilingual solutions to avoid fragmentation of the Digital Single Market.

02 Solution

To make language resources more usable by companies and researchers by proposing criteria and methodologies that enable both benchmarking and qualitative improvement and by defining a roadmap for the deployment of machine translation technologies for the future multilingual European landscape.

03 Impacts

LT-Observatory, is a sustainable infrastructure that will optimise the use of linguistic resources through federation and benchmarking..
